- 9. Background notes

1. Main points

The Consumer Prices Index (CPI) rose by 1.0% in the year to September 2016, compared with a 0.6% rise in the year to August.

The rate in September 2016 was the highest since November 2014, when it was also 1.0%.

The main upward contributors to change in the rate were rising prices for clothing, overnight hotel stays and motor fuels, and prices for gas, which were unchanged, having fallen a year ago.

These upward pressures were partially offset by a fall in air fares and food prices.

CPIH (not a National Statistic) rose by 1.2% in the year to September 2016, up from 0.9% in August.

2. Changes to publication schedule for economic statistics

From January 2017 we are improving the way we publish economic statistics, with related data grouped together under new "theme" days. This will increase the coherence of our data releases and involve minor changes to the timing of certain publications. For more information see <u>Changes to publication schedule for economic statistics</u>.

3. A brief description of consumer price inflation

Consumer price inflation is the rate at which the prices of goods and services bought by households rise or fall. It is estimated by using price indices. A way to understand this is to think of a very large shopping basket containing all the goods and services bought by households. Movements in price indices represent the changing cost of this basket. An <u>infographic</u> explains how consumer price inflation is calculated, and <u>Consumer price indices – a brief</u> <u>guide</u> gives an overview of the indices and their uses. Consumer price indices are published monthly.

A price index can be used to measure inflation in a number of ways. The most common is to look at how the index has changed over a year. This is calculated by comparing the price index for the latest month with the same month a year ago. This is known as the 12-month inflation rate. This bulletin measures inflation to September 2016, so the 12-month rate measures changes in prices between September 2015 and September 2016.

A range of measures of consumer price and other price inflation are published. <u>A tale of many price indices</u> summarises information on the different measures.

4 . Consumer Prices Index (CPI)

What is the CPI?

The CPI is a measure of consumer price inflation produced to international standards and in line with European regulations. First published in 1997 as the Harmonised Index of Consumer Prices (HICP), the CPI is the inflation measure used in the government's target for inflation.

The CPI is also used for purposes such as uprating pensions, wages and benefits and can aid in the understanding of inflation on family budgets. For more information see <u>Users and uses of consumer price inflation</u> <u>statistics (2013)</u>.

Latest figure and long-term trend

The CPI 12-month rate (the amount prices change over a year) between September 2015 and September 2016 stood at 1.0%. This means that a basket of goods and services that cost $\pounds100.00$ in September 2015 would have cost $\pounds101.00$ in September 2016.

This is the highest 12-month rate since November 2014, when it was also 1.0%. At this point, the rate had begun to fall, remaining at or around zero for much of 2015 before gradually picking up from the end of the year. The largest downward pull on inflation in September 2016 and for 2016 to date comes from prices for food and non-alcoholic beverages. Upward pressures come from a variety of categories, most notably restaurant and hotel bills. Transport prices provided a downward pressure during 2015 and early 2016 but this has eased during 2016 and they now have an upward effect.

Additional analysis of the Producer Price Index (PPI) and Consumer Price Index (CPI): September 2016 also published today, presents further analysis of the September PPI and CPI headline statistics and previous trends, with a particular focus on how movements in the sterling exchange rate may have influenced these data.

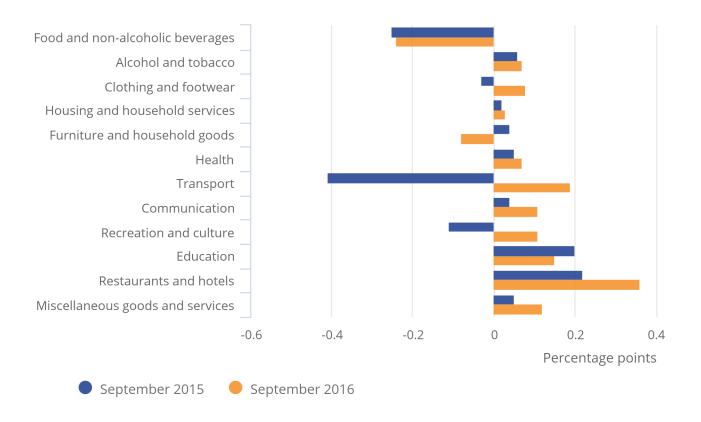

Figure 1 shows the contributions to the CPI 12-month rate in September 2016 compared with the contributions to the 12-month rate a year earlier.

Notes:

IК

1. From February 2016, CPI and CPIH indices have been re-referenced and published with 2015=100. This does not impact on published inflation rates.

Consumer Prices Index (CPI): What are the main movements?

This section explains which goods and services had the biggest impact on the change to the 12-month rate between August and September 2016 and, where relevant, considers the longer-term inflationary trends for these goods and services.

The change in the CPI 12-month rate can be calculated by comparing the 12-month rates for 2 consecutive months. An alternative, and equally valid, approach is to calculate it by comparing the price change between the latest 2 months and the price change between the same 2 months a year ago. Explaining the contribution to change in the 12-month rate (2013) is a diagram explaining the calculation.

The CPI rose by 0.2% between August and September 2016, compared with a fall of 0.1% between the same 2 months a year earlier. The 1-month movement was therefore higher this year compared with a year ago, leading to a rise in the CPI 12-month rate.

Between August and September 2016, the main upward contributions to change in the CPI 12-month rate came from the following groups.

Clothing and footwear: the upward effect came primarily from garments (in particular women's outerwear), for which prices rose by 6.0% between August and September 2016, compared with a rise of 3.3% a year ago. Whilst this rise is relatively large historically, there are factors to take into account when considering whether this is a result of sterling depreciation following the EU referendum result. First, a rise in clothing prices in September is in line with normal trends and the comparatively large increase this year follows a sustained fall in prices between March and July, with a relatively small increase into August. Second, whilst the depreciation in sterling is likely to increase the cost of importing goods and outsourcing production, there are reports of businesses having measures in place to protect against exchange rate changes in the short-term.

Restaurants and hotels: prices, overall, rose by 0.7% between August and September 2016, compared with a smaller rise of 0.2% a year ago. The upward contribution to the change in the 12-month rate was due to a rise in the price of an overnight hotel stay, compared with a fall a year ago. It is important to note that this follows an unusually large fall in August 2016.

Miscellaneous goods and services: prices, overall, rose by 0.5% between August and September 2016, having been unchanged between the same 2 months a year ago. The upward effect arose from smaller upward contributions across a range of items, most notably certain appliances and products for personal care.

Housing, water, electricity, gas and other fuels: overall, prices rose by 0.1% between August and September 2016, having fallen by 0.2% a year ago. The upward effect on the change in the 12-month rate came from prices for gas, which were unchanged between August and September 2016, having fallen by 2.1% between the same 2 months last year.

Transport: overall, transport made a small upward contribution to the change in the rate, although this masks larger effects within the group. Rising prices for motor fuels had a large upward effect, with petrol prices increasing by 1.2 pence between August and September 2016. In 2015, fuel prices fell throughout the second half of the year. This upward effect was largely offset by prices for air fares, which fell by 24.2% between August and September 2016, compared with a smaller fall of 20.4% a year ago.

The main downward contribution to the change in the CPI 12-month rate between August and September 2016 came from.

Food and non-alcoholic beverages: overall, this group made a small downward contribution to the change in the rate. A more pronounced effect was seen for food, with prices falling by 0.3% between August and September 2016, compared with a rise of 0.1% a year ago. This was due to a combination of smaller downward effects across a range of food items. The downward contribution from food was mostly offset by rising prices for non-alcoholic beverages, having fallen between the same 2 months a year ago.

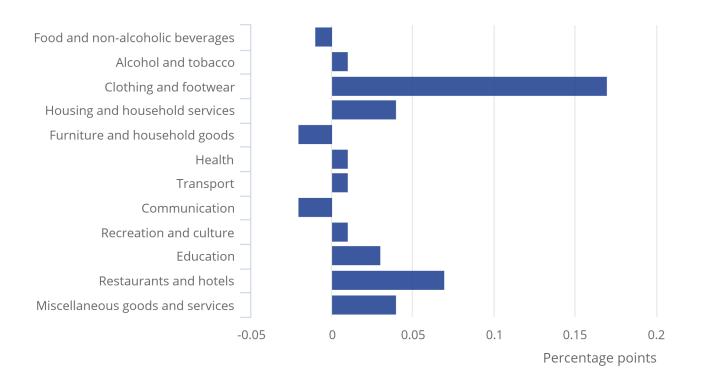

Figure 3 shows the contributions to change from each part of the CPI basket of goods and services.

Notes:

- 1. Individual contributions may not sum to the total due to rounding.
- 2. More information on the contents of each group can be found in Table 3 in the accompanying consumer price inflation dataset tables.

5. CPIH

In March 2016, the National Statistician wrote to the Chair of the UK Statistics Authority, setting out the intention for CPIH to become the ONS's preferred measure of inflation.

CPIH has been re-assessed to evaluate the extent to which it meets the professional standards set out in the Code of Practice for Official Statistics and the <u>assessment report</u> published on 3 March 2016. The report includes a number of requirements that need to be implemented for CPIH to regain its status as a National Statistic. The actions taken to address these requirements were reported to the UK Statistics Authority at the end of September 2016.

CPIH is a measure of UK consumer price inflation that includes owner occupiers' housing costs (OOH). These are the costs of housing services associated with owning, maintaining and living in one's own home. OOH does not include costs such as utility bills, minor repairs and maintenance, which are already included in the index.

CPIH uses an approach called rental equivalence to measure OOH. Rental equivalence uses the rent paid for an equivalent house as a proxy for the costs faced by an owner occupier. In other words, this answers the question "how much would I have to pay in rent to live in a home like mine?" for an owner occupier. OOH does not seek to capture increases in house prices. Although this may be inconsistent with some users' expectations of measures of OOH, the inclusion of an asset price and therefore capital gains would make the index less suitable as a measure of consumption. OOH currently accounts for 16.5% of the expenditure weight of CPIH. This compares with a weight of 19.5% in 2005.

Currently, the method of calculation, the population coverage, the basket of goods and services and the method of deriving the weights are the same as for the Consumer Prices Index (CPI), with the exception of OOH. A full description of how CPIH is compiled is given in the <u>Consumer Price Indices Technical Manual</u> and in various papers published on the <u>prices guidance and methodology webpage</u>.

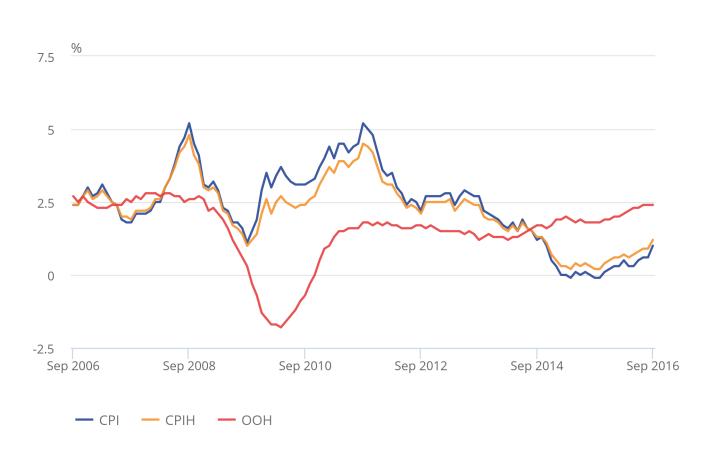

In September 2016, the 12-month rate (the rate at which prices increased between September 2015 and September 2016) for CPIH stood at 1.2%, up from 0.9% in August 2016. The difference between the CPI and CPIH annual rates in September 2016 was 0.2 percentage points, down from 0.3 percentage points in August. Owner occupiers' housing costs increased by 0.1% between August and September 2016, the same as the movement between these months a year earlier. This meant that they had a negligible impact on the change in the CPIH 12-month rate between the 2 months.

Figure 4 shows the CPIH and OOH component 12-month rates for the last 10 years. The CPI 12-month rate has been included for comparative purposes. Table 2 shows the CPIH and OOH component 1-month and 12-month rates and index values for the last year. More CPIH data are available in Tables 21 to 34 of the <u>Consumer Price</u><u>Inflation dataset</u>.

Notes:

1. From February 2016, CPI and CPIH indices have been re-referenced and published with 2015=100. This does not impact on published inflation rates.

2. CPIH has been re-assessed to evaluate the extent to which it meets the professional standards set out in the Code of Practice for Official Statistics. The assessment report includes a number of requirements that need to be implemented for CPIH to regain its status as a National Statistic.

6. Retail Prices Index (RPI) and RPIJ

In accordance with the Statistics and Registration Service Act 2007, the Retail Prices Index (RPI) and its derivatives have been assessed against the Code of Practice for Official Statistics and found not to meet the required standard for designation as National Statistics. The <u>full assessment report</u> can be found on the UK Statistics Authority website.

The RPI is a long-standing measure of UK inflation that has historically been used for a wide range of purposes such as the indexation of pensions, rents and index-linked gilts. For further information see <u>Users and uses of consumer price inflation statistics (2013)</u>.

RPIJ is an improved variant of the RPI and is calculated using formulae that meet international standards. The rationale for creating RPIJ was to give users a better alternative to the RPI if their needs were for a measure of inflation based on the same population, classifications, weights, etc as the RPI. Currently, RPIJ also acts as an analytical series in that it allows users to see the impact of using the Jevons (which meets international standards) in place of the Carli formula (which does not meet international standards) in the RPI. The use of the different formulae at the elementary aggregate level is currently the only difference between these indices. Detailed goods and services indices are not produced for RPIJ.

In September 2016, the 12-month rate for RPIJ stood at 1.3%, up from 1.0% in August. The RPI 12-month rate for September 2016 stood at 2.0%, meaning that it was 0.7 percentage points higher than it would have been had it used formulae that meet international standards.

Figure 5 shows the RPI and RPIJ 12-month rates for the last 10 years. Over this period the RPIJ 12-month rate has been, on average, 0.6 percentage points lower than the RPI.

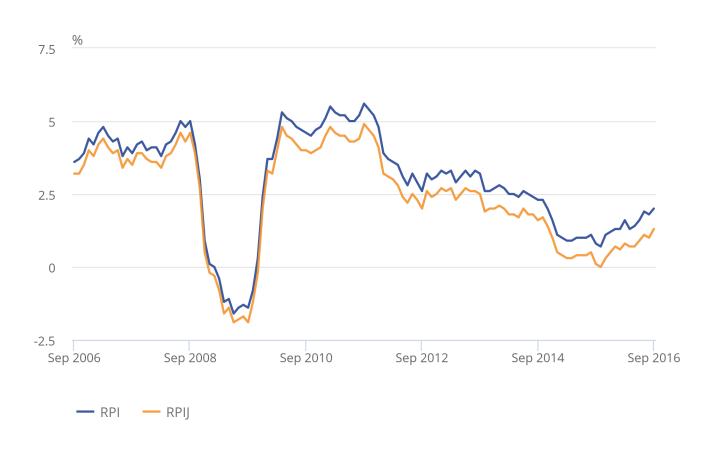

Table 3 shows the RPI and RPIJ 1-month and 12-month rates and index values for the last year.

Figure 5: RPI and RPIJ 12-month rates for the last 10 years: September 2006 to September 2016

1. These statistics are not National Statistics.

2. H = Latest headline figures, D = Detailed data (including disaggegations), T = Time series data.

8. Quality and methodology

Understanding and accessing the data

A full description of how consumer price indices are compiled is given in the <u>Consumer Price Indices Technical</u> <u>Manual</u>. This is supplemented by further information available from the <u>prices guidance and methodology</u> <u>webpage</u>.

The <u>CPI Quality and Methodology Information document</u> contains important information on:

- the strengths and limitations of the data and how it compares with related data
- users and uses of the data
- how the output was created
- the quality of the output including the accuracy of the data

The report was last updated in October 2013.

The mini Triennial Review of the CPI and RPI Central Collection of Prices is available.

All consumer price inflation data (including Excel dataset, time series data and explorable datasets) can be found on the <u>dataset page</u>.

To help you further, very detailed data are available, including the <u>individual price quotes (for locally collected</u><u>items only) and item indices</u> that underpin the consumer price inflation statistics. The item indices behind the measurement of owner occupiers' housing costs are included for the first time in the first quarter 2016 data. Please note, the data that are published are at a level which means that no individual retailer or service provider will be able to be identified. Previously the data published covered January 1996 to March 2016. The data for April to June 2016 are also now available. These data are updated once a quarter with around a 2-month lag with the latest CPI publication. For example, the data will next be updated when the November CPI is published on 13 December 2016, at which point the detailed data published will be extended to September 2016.

Internationally, the CPI is known as the Harmonised Index of Consumer Prices (HICP). HICPs are calculated in each member state of the European Union (EU) according to rules specified in a series of European regulations developed by the European Commission (Eurostat) in conjunction with the EU member states. Eurostat released figures for the Harmonised Index of Consumer Prices (HICP) for the month of September 2016 for EU member states, together with an EU average, on 17 October 2016. A summary of the latest European data is available from Eurostat's database tables. Further information on HICP for the EU, Euro area and other EU member states is available from Eurostat's HICP web page.

Methods – CPI and other measures of inflation

The CPI, CPIH, RPIJ and RPI are compiled using the same underlying price data, based on a large and representative selection of around 700 individual goods and services for which price movements are measured in around 140 randomly selected areas throughout the UK. Around 180,000 separate price quotations are used every month to compile the indices. The outlets in which the prices are collected are selected randomly. Expenditure weights are held constant for 1 year at a time.

The selection of goods and services that are priced to compile these indices is reviewed annually. The contents of the 2016 basket are described in an article <u>Consumer Price Inflation: The 2016 Basket of Goods and Services</u>. The expenditure weights used to compile the indices are also updated each year. Additional details of the updated weights for 2016 are available in an article published on 22 March 2016 entitled <u>Consumer Price Inflation: 2016 Weights</u>.

Rates of change for the CPI and CPIH are calculated from unrounded index levels, rather than from the published indices which are rounded to 1 decimal place. The use of unrounded indices increases the accuracy of the calculation. The unrounded index levels for the CPI and CPIH are available from Tables 63 and 64 of the <u>Consumer Price Inflation dataset</u>. By contrast, rates of change for the RPI and RPIJ are calculated from the published rounded indices.

Further information on the methods used to construct the CPI, CPIH, RPI and RPIJ, including differences in the methods used for each index, can be found in the <u>Consumer Price Indices Technical Manual</u>. <u>Users and uses of consumer price inflation statistics (2013)</u> provides further details of how consumer price statistics are used more generally.

9. Background notes

1. News

Following the results of an independent review, we will be implementing improvements to the way that chain-linking is conducted. Alongside this, we will introduce an additional level of detail in the Classification of Individual Consumption according to Purpose (COICOP) structure. For more information on the

background and impact of these changes, please see <u>Assessing the impact of methodological</u> <u>improvements on the Consumer Prices Index</u>. These changes will be introduced in the February 2017 index, to be published in March 2017.

2. Revisions policy

On 15 October 2013, a <u>revisions policy</u> was published for the suite of consumer price inflation statistics. The policy reaffirms the existing practices for CPI and RPI and sets out the policies for the new CPIH and RPIJ measures.

In summary, CPI, CPIH and RPIJ are revisable in theory though revisions only occur under exceptional circumstances. The RPI is never revised once published.

3. Publication policy

This bulletin includes the September 2016 data, collected on and around 13 September 2016. Future <u>publication dates</u> for this statistical bulletin are available to January 2019 (the publication of the December 2018 inflation figures). Publication dates from February 2018 onwards are provisional.

Consumer price inflation for October 2015 to October 2016 will be published on 15 November 2016.

4. Recorded message

Consumer price inflation recorded message (available after 9.45am on release day): Telephone: + 44 (0) 800 0113703

5. Code of Practice

<u>National Statistics</u> are produced to high professional standards set out in the <u>Code of Practice for Official</u> <u>Statistics</u>. They undergo regular quality assurance reviews to ensure that they meet customer needs. They are produced free from any political interference and released according to the arrangements approved by the <u>UK Statistics Authority</u>.

1 From the release of January data on 16 February 2016, CPI and CPIH indices will be re-referenced and published with 2015=100

2 More detailed CPI data are available at http://www.ons.gov.uk

3 The coverage of these categories was extended in January 2000; further extensions to coverage came into effect in January 2001 for health and miscellaneous goods and services; the coverage of miscellaneous goods and services was further extended with effect from January 2002.

1 From the release of January data on 16 February 2016, CPI and CPIH indices will be re-referenced and published with 2015=100.

2 More detailed CPI, CPIH, RPI and RPIJ data are available at: http://www.ons.gov.uk

3 The National Statistics status of CPIH has been discontinued pending work to investigate and improve the method for measuring owner occupiers' housing costs in this index. The improvements from the resulting development work were introduced as part of the February 2015 dataset with the historical series revised back to 2005.

4 In accordance with the Statistics and Registration Service Act 2007, the Retail Prices Index and its derivatives have been assessed against the code of Practice for Official Statistics and found not to meet the required standards for designation as National Statistics. A full report can be found at: http://www.statisticsauthority.gov.uk/ Source: Office for National Statistics

1 From the release of January data on 16 February 2016, CPI and CPIH indices will be re-referenced and published with 2015=100.

2 The National Statistics status of CPIH has been discontinued pending work to investigate and improve the method for measuring owner occupiers' housing costs in this index. The improvements from the resulting developSource: Office for National Statistics
