Notice

11 September 2018

This is the last time we will publish this article. Analysis of real earnings is provided in the [UK labour market statistical bulletin](#), and to give a more complete picture from just one publication, we will expand the Average weekly earnings section of that bulletin.

Contributions to nominal earnings growth can be found in the [EARN02 dataset](#).

Table of contents

1. [Introduction](#)
2. [Real average weekly earnings](#)
3. [Contributions to nominal AWE – single month](#)

1 . Introduction

This article presents two analyses of the average weekly earnings (AWE) figures, which are published in the [UK labour market statistical bulletin](#). These analyses are updated every month. The first section describes real AWE, which is AWE deflated by the [Consumer Prices Index including owner occupiers' housing costs \(CPIH\)](#). The second section analyses wages and employment contributions underlying single month movements in the nominal AWE.

2 . Real average weekly earnings

The figures show the recent movements in real average earnings (AWE) (whole economy). This is calculated as nominal unadjusted AWE, deflated by the Consumer Prices Index including owner occupiers' housing costs (CPIH). This series is calculated for total pay (including bonuses, excluding arrears) and regular pay (excluding bonuses, excluding arrears) at the whole economy level and then seasonally adjusted. The data in Figures 1 and 2 are levels of real and nominal AWE, shown on a monthly basis, with an index of 2015=100. Figure 3 shows three-month average year-on-year increases in these derived indices. The data are available in dataset [EARN01](#), together with estimates of real AWE at 2015 prices.

Comparing the three months to July 2018 with the same period in 2017, real AWE (total pay) rose by 0.2%, compared with a 0.1% rise in the three months to June 2018. Nominal AWE (total pay) grew by 2.6% in the three months to July 2018, while the CPIH increased by 2.3% in the year to each of May, June and July 2018.

In the same three-month period, real AWE (regular pay) rose by 0.5%, 0.2 percentage points more than the three months to June 2018. Nominal AWE (regular pay) rose by 2.9% in the three months to June 2018.

3 . Contributions to nominal AWE – single month

The wages and employment contributions underlying the latest average weekly earnings (AWE) data are available on our website in the [EARN02 dataset](#) each month. The “employment contribution”, shown in these figures, changes if the relative proportion of employment in the 24 industrial headings changes, but will not necessarily change if total employment increases. Employment contributions were significantly negative in 2009 and 2010, largely caused by a shift away from employment in financial and insurance activities, which are relatively highly-paid industries. In the period since 2015, the employment contribution has generally been slightly positive.

Figures 4 and 5 summarise the recent figures.
