# Population and migration statistics system transformation – recent updates

Updates on our latest progress and links to our related statistics and research reports. You can find more background on the transformation of the population and migration statistics system and what is happening between now and 2023 in our transformation overview article.

4. [Admin-based migration estimates \(ABME\), net migration and population estimates](#)
5. [Our latest migration analysis and insights](#)
6. [How to get in touch](#)

# 1 . Our latest international migration statistics

## Migration Statistics Quarterly Report (MSQR): August 2020, including long-term international migration estimates for the year ending March 2020

The [latest long-term international migration estimates](#) are based on International Passenger Survey (IPS) data for the period up to March 2020. The period in which data were collected from the IPS covers up to 16 March 2020. The IPS was suspended on this date because of the coronavirus (COVID-19). The weighting methodology has been adapted to compensate for these missing data. This compensation means that the reporting period for this release remains unchanged.

As a result of the Migration Statistics Transformation Journey, the IPS being stretched beyond its original purpose and the impact of the coronavirus pandemic, this will be the last Migration Statistics Quarterly Report (MSQR) based on IPS estimates. Administrative data will be used to deliver new measures of migration from November 2020 onwards.

Processing and quality assurance of the IPS data for Quarter 1 (Jan to Mar) 2020 identified a possible issue in the data, namely an unexpected large rise in the number of non-EU students interviewed in the IPS.

A detailed review of the data and associated processes suggests this may be because of the IPS being susceptible to sampling variability. This observation aligns with [previous analysis](#), which identified that large numbers of students may travel at the same time because of course start dates, meaning that some IPS shifts may include clusters of student contacts. If this was to occur, the IPS data may overestimate the number of long-term student migrants. This is a limitation of using a sample survey.

Uncertainty of this type in the data is represented by the [confidence intervals](#) around the estimates, which can be viewed in the associated datasets. Because of this oversampling, an adjustment, [in line with previous adjustments](#), has been applied to non-EU student immigration for the year ending Quarter 1 2020 estimates using Home Office visa allocations; this ensures we are providing the best possible estimates of migration based on all available sources. See [Section 6](#) of the statistical bulletin for more detail.

As it is recognised that international travel patterns have changed significantly in 2020 because of the coronavirus pandemic, we have also included in this release additional data and insights on recent travel patterns in the period up to the end of June 2020. See [Section 8](#) of the statistical bulletin for more detail.

## 2 . Local area migration indicators, UK

This release presents different migration-related data sources at local authority level including migration flows, non-UK-born and non-British populations, National Insurance number registrations, GP registrations, and births to non-UK-born mothers.

We have reduced the content of our Short-Term International Migration (STIM) publication to focus on our migration transformation work and the development of these statistics. Further information can be found in [Short-Term International Migration for England and Wales: year ending June 2018](#). As a result, the STIM table normally included in local area migration indicators (LAMIS) is not currently being produced. This means that the STIM data included in the LAMIS 2020 release are the mid-2016 to mid-2017 provisional data (previously published in the LAMIS 2019 release).

We welcome any thoughts you have on the development of STIM estimates in the future. If you would like to get in touch, please contact us by email at [pop.info@ons.gov.uk](mailto:pop.info@ons.gov.uk).

### 3 . Update on future migration publications

It was announced alongside the May 2020 Migration Statistics Quarterly Report (MSQR) that the August 2020 MSQR is the last set of long-term international migration estimates based upon International Passenger Survey (IPS) data.

As part of our transformation journey to make use of all available data sources to provide a richer and deeper understanding of migration, November 2020 will see the first admin-based migration estimates (ABME) report published. While the ABME report will replace the MSQR publication, it is important to recognise that the move to ABME reports marks a change in how we will report migration estimates.

As we progress our ambition to maximise the value and benefits of admin data, the initial ABME reports will not report migration data in the same way as the MSQR. The current availability of admin data means that the time periods reported upon in the MSQR, and some of the underlying detail such as reason for migration, will not be included in our initial ABME reports. However, it is important to recognise that this short-term change in content is an important step towards the delivery of a transformed migration system, one that makes best use of all available data sources and underpins a new robust, sustainable and coherent population and migration statistics system.

Our ABME reports will demonstrate iterative progress towards a transformed migration system and will provide users with clear messages on our next steps and challenges. As such, the ABME reports will, like the MSQR, be classified as [experimental statistics](#). As our work progresses, we look forward to being able to produce greater insights into migration patterns and statistics at an ever more granular level.

Alongside the November 2020 ABME report, we plan to publish a synthesis report bringing together a range of insights to highlight the impact the coronavirus (COVID-19) pandemic has had on international migration patterns so far.

### 4 . Admin-based migration estimates (ABME), net migration and population estimates

The November 2020 admin-based migration estimates (ABME) report will not provide a net migration figure for the year ending June 2020. However, given the suspension of the International Passenger Survey (IPS) because of the coronavirus (COVID-19) pandemic, it would not have been possible to provide a net migration figure for this period under the Migration Statistics Quarterly Report (MSQR) approach either. The impact of the coronavirus pandemic, complexities of sampling and the suspension of the IPS have highlighted the challenges of the current migration system and accelerated our plans to harness the power of admin data and progress our transformation journey.

The net migration figure for the year ending June 2020, usually published in November, would normally feed into the calculation of our mid-year population estimates. We are currently working with our colleagues in Population Statistics to agree a suitable method for providing data for this period.

The November ABME report will focus on providing an overview of main data sources using an admin data quality framework. Alongside this, the report will also provide our first iteration of ABMEs, alongside analysis that compares our new approach with the existing back series of Long-Term International Migration (LTIM) estimates.

## 5 . Our latest migration analysis and insights

Our transformation mission is to provide the best insights on population and migration using a range of new and existing data sources to meet the needs of our users. This is increasingly important in a rapidly changing policy and societal context, where we know our users need better evidence to support decision-making at both national and local levels.

In addition to the regular outputs described in the earlier sections, we deliver analysis and insights into important migration topics based on user needs. This section summarises the latest analysis and insights from the Centre for International Migration.

### Coronavirus and non-UK key workers

Today (8 October 2020), we released [new insights on non-British nationals and non-UK-born in the workforce between 2017 and 2019](#). This includes a focus on those who could be considered as key workers in the response to the coronavirus (COVID-19) pandemic. It also includes interactive maps for users to explore the proportion of non-British national workers and key workers living in local areas.

### Previous analysis articles

The following analysis articles include further insights on international migration patterns and sectors:

- [What can administrative data sources tell us about the patterns of presence of non-EU students?](#) (February 2020)
- [International migration and the healthcare workforce](#) (August 2019)
- [International migration and the education sector – what does the current evidence show?](#) (May 2019)

## 6 . How to get in touch

We welcome your feedback on our latest updates and on our transformation journey. If you would like to get in touch, please contact us by email at [pop.info@ons.gov.uk](mailto:pop.info@ons.gov.uk).
