Release date:
26 June 2014

Next release:
25 June 2015

Notice

1 April 2016

We have recently been made aware of errors mainly affecting the age distribution of the mid-year population estimates for Scotland for the years 2002 to 2014. These errors only affect areas within Scotland; population estimates for England, Wales and Northern Ireland are unaffected. Whilst the estimated age distribution of the UK population is affected for the period, the total estimates of the UK population remain valid. We have published [Frequently Asked Questions](#) that provide further information on the errors

We plan to publish corrected UK population estimates for the years 2012 to 2014 incorporating corrected estimates for Scotland on 28 April 2016.

18 September 2014

Population estimates for the UK at subnational level for mid-2013 have been revised to address the previously announced error in the distribution of the foreign armed forces (FAF) special population presented in the this release. The revised estimates were published on the 25 June 2015 as part of the mid-2014 release and supersede the estimates in these tables. The [revised estimates are available on our website](#) and details for further population estimates releases can be found on the [UK statistics GOV.UK. release calendar](#).

1 . Key points

- The population of the UK grew to 64.1 million in mid-2013, representing a gain of 400,600 (0.63%) over the previous year mid-2012. This growth is slightly below the average since 2003.
- This means that the UK's population has increased by around 5 million since 2001, and by more than 10 million since 1964.
- Natural change (births minus deaths) contributed slightly more than net international migration to the population gain in the year. There were 212,100 more births than deaths (53% of the increase) and 183,400 more immigrants arriving than emigrants leaving (46% of the increase).
- The estimated populations of the four constituent countries of the UK in mid-2013 are 53.9 million (growth of 0.70%) in England, 5.3 million (growth of 0.27%) in Scotland, 3.1 million (growth of 0.27%) in Wales and 1.8 million (growth of 0.33%) in Northern Ireland.
- There were 792,400 births and 580,300 deaths in the year ending 30 June 2013. The number of births decreased from the previous year but is still above average for the last decade. The number of deaths increased from the previous year and is the highest since the year to mid-2005.
- The population of the UK aged 65 and over was 11.1 million (17.4% of the UK population) in mid-2013, up by 290,800 from mid-2012. The number of people in this age group has increased by 17.3% since 2003.
- Growth of the UK population in the year to mid-2013 was higher than the EU average and highest of the four most populous EU member states.

2 . Introduction

The mid-year estimates refer to the population on 30 June of the reference year and are published annually. They are the official set of population estimates for the UK and its constituent countries, the regions and counties of England, and local authorities and their equivalents. This publication relates to the mid-2013 estimates of the UK.

The UK mid-year estimates series brings together population estimates that are produced annually for England and Wales by the Office for National Statistics (ONS), for Scotland by the National Records of Scotland ([NRS](#)) and for Northern Ireland by the Northern Ireland Statistics and Research Agency ([NISRA](#)). The timetables for population outputs are available for each country on their respective websites.

The official 2013 mid-year estimates for the UK referred to in this bulletin, build on the mid-2012 estimates, which are updated to account for population change during the period between 1 July 2012 and 30 June 2013 to give the mid-2013 estimates. A combination of registration, survey and administrative data are used to estimate the different components of population change.

Mid-year population estimates relate to the usually resident population. They account for long-term international migrants (people who change their country of usual residence for a period of 12 months or more) but do not account for short-term migrants (people who come to or leave the country for a period of less than 12 months).

The mid-year population estimates are essential building blocks for a wide range of National Statistics. They are used directly as a base for other secondary population statistics, such as population projections, population estimates for the very old and population estimates for small geographical areas. They are used for weighting survey estimates such as the Labour Force Survey and other social surveys to ensure that they are representative of the total population, and they are used as denominators for rates or ratios, for example in health and economic indicators.

The mid-year population estimates are an important input for a wide number of economic and social statistics. Main users include central and local government and the health sector, where they are used for planning and monitoring service delivery, resource allocation and managing the economy. Additionally, they are used by a wider range of organisations such as commercial companies (for market research), special interest groups and academia as well as being of interest to the general public.

Further information on population estimates across the UK including methodology, quality and data sources is available in an [information note \(100.8 Kb Pdf\)](#) .

3 . What do the mid-2013 UK population estimates show?

This section describes the latest UK population estimates within the context of the historical time series of the estimates, setting out the drivers behind the population trends observed. It shows the latest available estimates for mid-2013 together with the components of population change estimated for the period 1 July 2012 to 30 June 2013.

The population of the UK surpassed 64 million for the first time in mid-2013 with the total UK population standing at 64,105,700.

Figure 1: Mid-year population estimates for the UK mid-2013

Source: Office for National Statistics, National Records of Scotland, Northern Ireland Statistics and Research Agency

Comparing the latest population estimates for mid-2013 with the mid-2012 estimates shows that:

- The population of England increased by 372,100 (0.70%) to 53,865,800 accounting for 84% of the UK's population; England's population grew quicker than any other UK country during the year;
- The population of Scotland increased by 14,100 (0.27%) to 5,327,700 and accounts for 8% of the UK's population;
- The population of Wales increased by 8,300 (0.27%) to 3,082,400 and accounts for 5% of the UK's population; and
- The population of Northern Ireland increased by 6,100 (0.33%) to 1,829,700 and accounts for 3% of the UK's population.

Changes in UK population

Since 1964 the population of the UK has grown by more than 10 million people (18.7%). About half of this growth has occurred since 2001.

Over the earlier part of this period population change was driven mainly by variation in the number of births. Population grew throughout the 1960s up until the early 1970s mainly as a result of the 1960s baby boom; while over the rest of the 1970s growth was subdued, reflecting falling fertility. The very large birth cohort of 1960s baby boomers beginning to have children saw births, and hence the population, grow again in the 1980s, but births declined again through the 1990s.

A time series of UK births and deaths data on a calendar year basis is available in the [Population and Health Reference Tables](#) published by ONS.

Since 2001 there have been high levels of net inward migration, adding to the population at younger working ages. In part this was driven by the expansion of the European Union in 2004 and 2007. This period has also seen an increasing number of births, driven by both the immigration of women of childbearing age (15-44) and rising fertility among UK-born women.

More detail on births and fertility is available in the [Births in England and Wales, 2012](#) release published by ONS, the [Vital Events Births Reference Tables](#) published by NRS and the [Births](#) statistics published by NISRA.

Figure 2: Mid-year population estimates and annual change for the UK mid-1964 onwards

Source: Office for National Statistics, National Records of Scotland, Northern Ireland Statistics and Research Agency

During the late 1990s and first decade of the 21st century, net international migration (the difference between the numbers immigrating to the UK and the numbers emigrating from the UK) started to contribute more to population change. At its peak in the year to mid-2005, net inward migration accounted for around 69% of population growth. Detailed international migration data for the UK is available in the [Migration Statistics Quarterly Report](#) series produced by ONS.

The years since mid-2002 have also seen a marked increase in the number of births, with the number occurring in the year to mid-2012 being the highest since the year to mid-1972, although this is not necessarily the case for all UK countries, for example Scotland.

Figure 3: Main drivers of population change for the UK mid-1992 onwards

Figure 3: Main drivers of population change for the UK mid-1992 onwards

Source: Office for National Statistics, National Records of Scotland, Northern Ireland Statistics and Research Agency

Population change in the year to mid-2013

In the year to mid-2013, there were 792,400 births and 580,300 deaths, resulting in a population increase of approximately 212,100 due to natural change - the balance of births minus deaths. Over the same period 503,700 international migrants arrived in the UK and 320,400 migrants left the UK to live abroad. Together with other small adjustments, all these changes resulted in a net increase in population of 400,600.

Compared to the last decade, the population change for the year to mid-2013 has some notable highlights:

- Both international migration inflow and outflow figures are at their lowest for a decade. Net migration however shows an increase on last year, though it remains less than the average figure for the period;
- The number of births is down on last year's figure but is still above average for the period. The number of deaths has risen since last year, and is slightly higher than the period average.

Table 1: Components of population change, UK, last ten years

Mid-Year (Start)	Mid-Year Start Population	Births	Deaths	International Immigration	International Emigration	Other Changes	Mid-Year End Population	Mid-Year (End)
2003	59,636.7	707.1	603.3	547.0	352.7	15.6	59,950.4	2004
2004	59,950.4	717.6	590.6	666.3	346.2	15.9	60,413.3	2005

2. Other Changes comprises changes to the size of armed forces stationed in the UK and other special population adjustments

Countries of the UK and regions of England

Population growth in the year to mid-2013 was greatest in southern and eastern England. London had the highest population growth, with population up 1.30% - which is average for that region over the last decade. The East, South East and South West regions of England increased by 0.79%, 0.78% and 0.71% respectively.

The lowest regional population increases in the year were seen in Scotland, Wales and the North West of England, all growing by 0.27%. The population of Northern Ireland grew by 0.33%. Only the North East of England grew by more than its average over the decade during this year. No country of the UK or region of England experienced a population decrease.

Table 2: Population change in the year to mid-2013, UK countries and regions of England

	Mid-2012 Population (thousands)	Mid-2013 Population (thousands)	Percentage Change	10 Year Average Percentage Change
United Kingdom	63,705.0	64,105.7	0.63	0.73
England	53,493.7	53,865.8	0.70	0.79
North East	2,602.3	2,610.5	0.31	0.27
North West	7,084.3	7,103.3	0.27	0.42
Yorkshire and The Humber	5,316.7	5,337.7	0.40	0.60
East Midlands	4,567.7	4,598.7	0.68	0.78
West Midlands	5,642.6	5,674.7	0.57	0.64
East	5,907.3	5,954.2	0.79	0.84
London	8,308.4	8,416.5	1.30	1.30
South East	8,724.7	8,792.6	0.78	0.84
South West	5,339.6	5,377.6	0.71	0.72
Scotland	5,313.6	5,327.7	0.27	0.50
Wales	3,074.1	3,082.4	0.27	0.48
Northern Ireland	1,823.6	1,829.7	0.33	0.71

Source: Office for National Statistics, National Records of Scotland, Northern Ireland Statistics and Research Agency

Notes:

1. Figures may not add exactly due to rounding

Detailed data on population change at local authority level for this release is available in the [data section of this publication](#). ONS also produces population estimates for other [geographies](#) such as [parliamentary constituencies](#), [national parks](#), [wards](#), and [health areas](#) for England and Wales. Population estimates for special areas in Scotland are produced by NRS, and NISRA produces subnational population estimates for Northern Ireland.

London had the largest natural change of all regions with 82,900 more births than deaths; Scotland had the lowest natural change with just 900 more births than deaths.

London was the destination of more than a third of international migrants arriving in the UK - contributing to it having the highest net international migration of all regions at 79,500 - up slightly from last year; Northern Ireland had the lowest net international migration with 900 more people emigrating than arriving to stay from abroad.

The South East of England received more people from other parts of the UK than any other region leading to a 24,900 population increase; and London continued its pattern of having the greatest outflow of people to other parts of the UK of any region, with a net loss of more than 55,000 people. More people of every age left London for other parts of the UK than arrived, except for people aged 21-28, more of whom arrived in London from other parts of the UK than left.

Approximately two-thirds (64%) of the people moving out of London went to the South East and East of England, a similar picture to last year.

Detailed data on population change is available as part of the [population estimates analysis tool \(10.43 Mb ZIP\)](#) accompanying this release. The latest information on internal migration is available in the 2013 [Internal Migration by Local Authorities in England and Wales](#) release.

Table 3: Detail of population change, year to mid-2013, UK countries and Regions

	Population increase	Births minus Deaths	Net International Migration	Net within UK Migration	Other Changes
United Kingdom	400.6	212.1	183.4	0.0	5.2
England	372.0	199.8	174.8	-5.7	3.2
North East	8.2	2.6	6.6	-1.4	0.4
North West	18.9	17.4	9.8	-8.5	0.3
Yorkshire and The Humber	21.0	14.6	12.7	-6.8	0.5
East Midlands	31.0	11.7	12.7	5.6	1.0
West Midlands	32.1	19.9	14.0	-3.0	1.3
East	46.8	19.0	12.6	17.5	-2.3
London	108.2	82.9	79.5	-55.0	0.7
South East	67.9	26.5	16.1	24.9	0.4
South West	38.0	5.1	10.9	21.0	0.9
Scotland	14.1	0.9	2.1	7.9	3.2
Wales	8.3	1.8	7.3	-0.7	-0.1
Northern Ireland	6.1	9.6	-0.9	-1.5	-1.1

(thousands)

Source: Office for National Statistics, National Records of Scotland, Northern Ireland Statistics and Research Agency

1. Figures may not add exactly due to rounding
2. Net within UK Migration is the balance of in and out moves between each region and other regions in the rest of the UK.
3. Other Changes comprises changes to the size of armed forces stationed in the UK and other special population adjustments.

Natural change contributed slightly more than net international migration to population change for the UK in the year to mid-2013. Predictably England showed the same pattern to that of the UK. Internal migration moves from other parts of the UK contributed to more than half (56%) of the growth in Scotland's population in the year, with international migration and natural change combined accounting for around just a fifth (21%) of the gain.

The majority of gain in the population of Wales during the year was due to international migration. Northern Ireland's population growth was driven entirely through natural change, with 24,500 births offsetting 15,000 deaths, 2,300 net moves out of Northern Ireland and a loss of 1,100 due to other changes.

Population Structure

In mid-2013, the population of the UK consisted of 31,532,900 males (49.19%) and 32,572,800 females (50.81%).

Figure 4: Population pyramid for the UK, mid-2013

Source: Office for National Statistics, National Records of Scotland, Northern Ireland Statistics and Research Agency

The pyramid stops at age 89, causing the top of the pyramid to be flat. Although estimates of older people (those aged 90 and over) are included in the mid-2013 UK population estimates, more detailed estimates by single year of age are available in the [Estimates of the Very Old \(including Centenarians\) for the United Kingdom](#) release covering mid-2012.

The size and composition of the population shown in the pyramid is determined by the pattern of births, deaths and migration which have taken place in previous years. The pyramid shows some important trends in the demographics of the UK:

- The number of males aged 75 and over in the UK has increased by 25.1% since mid-2003. This compares to an increase of 6.7% for females in this age group over the same period. The faster improvement in male mortality is largely driven by changes seen in tobacco smoking and advances in health treatments for circulatory illnesses. Male occupations over the same period have also become less physical and safer. Detailed explanation of this theme is available in the [National Life Tables](#) release from March 2014.
- The effects of immigration to the UK that has happened since mid-2003. For most ages the peaks and troughs present in the pyramid in mid-2003 are visible in the mid-2013 data shifted by 10 years, demonstrating the cohort ageing of the population. The mid-2013 pyramid however, shows some difference in this pattern. At each age for 10 to 45 there are more people than in the mid-2003 data, especially so for those aged 21 to 35: here the profile is much wider and flatter than in the mid-2003 pyramid. Such a change can only be generated by new population being added through immigration.
- The number of births has increased year on year since mid-2003, with only a drop in the current year to mid-2013. There are 611,200 more zero to four year olds in mid-2013 than there were in mid-2003. The number of children aged 5 to 16 is 302,900 fewer than in mid-2003 – a result of the lower births around the turn of the century.

The median age of the population of the UK at mid-2013 was 39.9, a slight increase since last year, caused by the growth in population at older ages. At country level median ages range from 37.8 in Northern Ireland to 41.9 in Wales. An interactive population pyramid showing the age structure of the population of the UK by country, English region and county or UK local area is available as part of the [population estimates analysis tool \(10.43 Mb ZIP\)](#).

4 . European comparisons

The population of the UK grew by more than any other EU member state in the year to mid-2013, and at a faster rate than the total EU. From the top ten largest population increases in the year, only Sweden had a higher growth rate than the UK.

Table 4: EU states with largest absolute population growth, mid-2013

	(thousands)			
	Mid-2012 Population	Mid-2013 Population	Increase	Percentage Change
EU (28 countries)	504,582.5	505,665.7	1,083.2	0.21
United Kingdom	63,705.0	64,105.7	400.6	0.63
Italy	59,394.2	59,685.2	291.0	0.49
France	65,287.9	65,578.8	291.0	0.45
Germany	80,327.9	80,523.7	195.8	0.24
Sweden	9,482.9	9,555.9	73.0	0.77
Belgium	11,094.9	11,161.6	66.8	0.60
Netherlands	16,730.3	16,779.6	49.2	0.29
Austria	8,408.1	8,451.9	43.7	0.52
Finland	5,401.3	5,426.7	25.4	0.47
Denmark	5,580.5	5,602.6	22.1	0.40

Source: Office for National Statistics, National Records of Scotland, Northern Ireland Statistics and Research Agency, Eurostat

Notes:

1. EU estimates have reference date of 1 Jan as compared to the UK reference date of 30 Jun of each year.
2. Population estimates for EU member states obtained from Eurostat and are the latest available at the time of publication.
3. EU (28 countries) includes data for Croatia which joined the EU on 1 Jul 2013.

EU estimates have reference date of 1 Jan as compared to the UK reference date of 30 Jun of each year. Population estimates for EU member states obtained from [Eurostat](#) and are the latest available at the time of publication. EU (28 countries) includes data for Croatia which joined the EU on 1 Jul 2013.

The population of the UK had the highest rate of growth of the four most populous EU member states in the year to mid-2013; although this was lower than the UK's average annual change over the last decade. The average annual growth over the last decade was higher than that seen in Germany, France or Italy.

Figure 5: Change in population of the most populous EU states, last ten years

2. Population estimates for EU member states obtained from Eurostat and are the latest available at the time of publication
3. Owing to population rebasing of Germany's estimate for the year 2012 average change for EU and Germany omits this year
4. EU (28 countries) includes data for Croatia which joined the EU on 1 Jul 2013

EU estimates have reference date of 1 Jan as compared to the UK reference date of 30 Jun of each year. Population estimates for EU member states obtained from [Eurostat](#) and are the latest available at the time of publication. Owing to population rebasing of Germany's estimate for the year 2012 the average change for EU (28 Countries) and Germany omits this year. EU (28 countries) includes data for Croatia which joined the EU on 1 Jul 2013.

5 . Other population estimate releases and user engagement

This release of population estimates for the UK is the seventh ONS population estimates product to be published based on the results of the 2011 Census. Corresponding estimates for Super Output Areas, wards, Parliamentary Constituencies, Health Areas and National Parks will be released later in 2014.

Birth and death figures for the 2013 calendar year in England and Wales will be published by ONS on 16 July 2014.

Publication dates for these will be confirmed on the UK statistics Publication Hub [release calendar](#).

The Office for National Statistics would welcome your comments on the usefulness and presentation of the population estimates in this release. Please contact the Population Estimates team using the email address pop.info@ons.gsi.gov.uk.

6. Background notes

1. National Statistics are produced to high professional standards set out in the Code of Practice for Official Statistics. They undergo regular quality assurance reviews to ensure that they meet customer needs. They are produced free from any political interference.
2. The distribution of the foreign armed forces (FAF) special population presented in this release has been incorrectly calculated for certain local authorities in England. This error has a significant impact on the estimate for Forest Heath, where the published population estimate is 3.3% higher than the correct value. The impact in other affected local authorities is much smaller. The error is also reflected in the population estimates of the associated county and region totals which are derived by aggregating the affected local authority figures. Similarly the 'other' category of components of change reflects this difference. Further detail on the error, together with a list of affected local authorities and the size of the error in each area, is provided in the [Quality Management Information](#) document available on the ONS website.
3. Mid-2013 population estimates data for the UK are available on the [ONS website](#). Published tables for mid-2013 include summary population of the UK by quinary age; detailed population by single year of age and sex; region, county and local authority areas for England; local authority areas for Wales; council areas for Scotland; district council areas for Northern Ireland. Aggregate components of population change estimates are provided for all geographies.
4. Mid-2013 population estimates data for Scotland are available on the [NRS website](#).
5. Mid-2013 population estimates data for Northern Ireland are available on the [NISRA website](#).
6. A [population estimates analysis tool \(10.43 Mb ZIP\)](#) is available for users to produce simple reports on the mid-2013 UK population data. This tool also provides access to detailed components of change by single year of age and sex by region, county and local authority areas for England; local authority areas for Wales.
7. An [information note](#) describing the methodology used to create the UK population estimates and differences in approach within the UK is available.
8. Net international migration estimates quoted in this report include net flows of asylum seekers where applicable. Other changes include moves of armed forces personnel at home and overseas.
9. Population components in the mid-year estimates may vary from those published in other ONS outputs due to definitional differences and context of use:
 - Estimates of births and deaths used in the mid-year estimates are based on births and deaths that occur during the year to the mid-year reference point that have been registered by a particular point in time. This definition is different to that used in ONS, NRS and NISRA publications on births and deaths. The majority of UK mortality statistics are based on deaths registered in a particular calendar year rather than the year the death occurred. This allows for more timely publication of complete statistics. Birth statistics for England and Wales are based on the number of births occurring in a calendar year while Scotland and Northern Ireland statistics relate to the number of births registered in a calendar year;

- Estimates of international migration used in the mid-year estimates are based partly on provisional LTIM data rather than final, and will therefore not tally exactly with the final year-to-end-June figures published in the Long-Term International Migration series or alternative reporting periods (for example calendar year).

More information is provided in the [Quality Management Information](#) document on the ONS website.

10. This is the first release of mid-2013 population estimates for the UK. No revisions of this dataset have been made.
11. A list of those people that have pre-release access can be found on the [ONS website](#).
12. Details of the policy governing the release of new data are available from the Media Relations Office.

The United Kingdom Statistics Authority has designated these statistics as National Statistics, in accordance with the Statistics and Registration Service Act 2007 and signifying compliance with the Code of Practice for Official Statistics.

Designation can be broadly interpreted to mean that the statistics:

- meet identified user needs;
- are well explained and readily accessible;
- are produced according to sound methods; and
- are managed impartially and objectively in the public interest.

Once statistics have been designated as National Statistics it is a statutory requirement that the Code of Practice shall continue to be observed.
